BR 1.2.7.1.1 will be deployed into production on 07/21/2009

Change Request/Bug Fixes

Incident to Incident Transfers

1. In the current design, a problem was discovered when trackable kits and trackable items were transferred to another incident and a return was processed. The trackable status was not updated throughout the system so that the return could be processed.
2. The problem has been corrected where the trackable kit and/or trackable item can be returned from the last incident that the item(s) were transferred to.
3. An additional correction was made so that a node other than the owner or original node that issued the trackable kit and/or item can process an incident to incident transfer and a return.

System

1. The system timeout setting has been increased to 60 minutes.

Database

1. The catalog interface problem between ICBS and ROSS has been corrected.

Misc

1. Script files will be deployed to correct trackable inventory status problems in a few of the caches.
