NAP Version 1.3.5 Release Notes

This is a synopsis of the new and corrected functionality included in NAP version 1.3.5. The primary objective for this release is to fix defects and improve performance of the NAP web services.

Installation

No user action is required.

New or Changed Functionality

- Standard user accounts with no activity will not be disabled until after 180 days (increased from the current value of 90 days). Note that the password for a standard account will still expire after 60 days, but the user can now reset it up to 180 days after correctly answering a challenge question.
- The Authentication web service can now optionally return user lookup information. This allows calling systems (such as ROSS) to eliminate a second call to the User Lookup web service.

Reports Changes

- None

Additional Change Requests and Defects Fixed in this Version

- The mouse pointer now displays the "hand" symbol when hovering over all links in NAP.
- Eliminated duplicate user account notifications that were being sent to ROSS (and then on to Altaris CAD).
- Modified the Delete Role web service to return a warning when the user account does not have access to the requested application instance.
- Reduced user account notifications sent to ROSS, to only include notifications for users that have access to ROSS.
- Improved the performance of the Authentication web service.
- Fixed the defect that was causing the popup alert message when logging into NAP with an account for which the password is about to expire.
