<u>**NAP Version 1.3.7 Release Notes**</u>

This is a synopsis of the new and corrected functionality included in NAP version 1.3.7. The primary objective for this release is to fix defects that have been identified in the Production environment, and improve efficiency for account administrators.

Installation

No user action is required.

New or Changed Functionality

- Privileged access can no longer be requested for Web Status (WSR-PROD), so that account approvers do not have to reject such requests.

Reports Changes

- None

Additional Change Requests and Defects Fixed in this Version

- Fixed "lazy initialization" error that occurred when the Current Password was entered incorrectly while changing a password.
- Fixed database foreign key error when approving a vendor contact account request. The foreign key constraint was previously disabled in the production database, and will be re-enabled with the deployment of this fix.
- Fixed problem that prevented a privileged account to be added to a NAP user, after a name change for the user.
- Added web service capability to support a change in ROSS to allow searching of NAP accounts when adding a user account to ROSS.
